

HSS/DRESS

Criteria for rash suggesting DRESS

- scaling/desquamation
- facial edema
- purpura
- infiltration
- at least 2 symptoms should be present to give 1 point (yes), otherwise 0/unknown something that predicts s.th. else -1 (no)

liver involvement

- ALAT or alkaline phosphatases at least at 2 successive dates abnormal values,
- elevation must be twice than normal for alat and > 1.5 for AP
- definition of excessive alcohol intake????

lung involvement

any evidence of interstitial involvement (X-ray, Scan...) abnormal BAL (lavage), abnormal blood gases
cough is not enough

kidney involvement

creatinine level more than 1.5 time the basal level for the patient and or proteinuria above 1g/d

muscle/heart

raised CK, Troponin T, ECHO, weakness/pain is not enough

pancreas

(amylase 2 or 3 times above normal) has to be checked

serology

- hepatitis: at least 2 negative and 1 unknown => counted as negative
- mycoplasma/chlamydia: at least 1 negative and 1 unknown => counted as negative
- ebv/cmV: at 1 negative and 1 unknown => counted as negative

if hepatitis and mycoplasma/chlamydia negative but incomplete as described above and only one further negative result (either ANA or blood culture) => extra point is expert decision
